The Problem of Interest

New Section for Illustrative Purposes

Does this work?

This is an interesting example

Let's Try Another One

Does this work as well?

This is rather fun

Let's Try Ansdsdsdsother One1

Does this work as well111sdsds1?

This is rather fu111sdsdsds111n

Dataset

1. The dataset used was from "Survival Analysis - Techniques for Censored and Truncated Data".
2. It was a hypothetical study of the mortality experience of diabetics.
3. 30 diabetics were followed till death or the end of the study.
4. The subject's age at entry into the study and the age at the end of the study or death were recorded.
5. Rather than time to event analysis, I was interested in how "entry age" and "exit age", affected survival.
6. The response variable, survival, was binary (=1 if alive, =0 if dead).

The Problem of Interest
