## 1.1 The Basic Problem That We Studied

# What Are Prime Numbers?

## Definition

A prime number is a number that has exactly two divisors.

## Example

- 2 is prime (two divisors: 1 and 2).
- 3 is prime (two divisors: 1 and 3).
- 4 is not prime (**three** divisors: 1, 2, and 4).

# There Is No Largest Prime Number

The proof uses reductio ad absurdum

## Theorem

There is no largest prime number.

## Proof

1 Suppose  $p$  were the largest prime number.

# There Is No Largest Prime Number

The proof uses *reductio ad absurdum*

## Theorem

There is no largest prime number.

## Proof

- 1 Suppose  $p$  were the largest prime number.
- 2 Let  $q$  be the product of the first  $p$  numbers.

# There Is No Largest Prime Number

The proof uses reductio ad absurdum

## Theorem

There is no largest prime number.

## Proof

- 1 Suppose  $p$  were the largest prime number.
- 2 Let  $q$  be the product of the first  $p$  numbers.
- 3 Then  $q + 1$  is not divisible by any of them.

# There Is No Largest Prime Number

The proof uses *reductio ad absurdum*

## Theorem

There is no largest prime number.

## Proof

- 1 Suppose  $p$  were the largest prime number.
- 2 Let  $q$  be the product of the first  $p$  numbers.
- 3 Then  $q + 1$  is not divisible by any of them.
- 4 But  $q + 1$  is greater than 1, thus divisible by some prime number not in the first  $p$  numbers.

The proof used *reductio ad absurdum*.

- Open Questions
  - Is every even number the sum of two primes?

# An Algorithm For Finding Prime Numbers.

## Finding Prime Numbers

```
int main (void)
{
    std::vector<bool> is_prime (100, true);
    for (int i = 2; i < 100; i++)
        if (is_prime[i])
        {
            std::cout << i << "_";
            for (int j = i; j < 100; is_prime [j] = false, j+=i);
        }
    return 0;
}
```

# An Algorithm For Finding Prime Numbers.

## Finding Prime Numbers

```
int main (void)
{
    std::vector<bool> is_prime (100, true);
    for (int i = 2; i < 100; i++)
        if (is_prime[i])
        {
            std::cout << i << "_";
            for (int j = i; j < 100; is_prime [j] = false, j+=i);
        }
    return 0;
}
```

Note the use of `std::`.
